

Making Magic with F# Type Providers

Dr Kenji Takeda (@ktakeda1)
Microsoft Research

#fsharp

Proposition 1

We are living through an information
revolution

The Information Revolution

Proposition 2

Our programming languages are
information-sparse

Proposition 3

This is a big problem

especially for statically typed languages
(Java, C#, F#, VB, ...)

We need to bring information into the
language...

At internet-scale, strongly tooled, strongly typed

But before we get into that...

Part 1

Functional-first Programming and F#

F# is free, open source, cross platform,
independent

fsharp.org

Microsoft contribute to F#, and so do many others

The Visual F# Tools from Microsoft are supported, enterprise-ready and come with Visual Studio

The Recurring Business Situation

"I lead a team developing..."

- Analytical Components
- Data-rich Services
- Analytical Components
- Data-rich Services
- Analytical Components
- ...

The Recurring Business Problems

Time to Market

Efficiency

Correctness

Complexity

- for analytical components

Is Time to Market a Problem?

Late Models → Missed market opportunities

Financial model

Late Services → Users have gone elsewhere

Gaming service

Late Components → Millions evaporate

Ad ranking engine

Is Correctness a Problem?

Buggy Models → Major risks to institutions

Quant model

Buggy Services → Users walk away

Gaming service

Buggy Analytical Components → Millions leak away

Ad ranking engine

Is Complexity a Problem?

Intractable Models → Can't enter markets

Intractable Services → Can't deliver services

Intractable Analytical Components → Can't ship

The Recurring Business Problems

Time to Market

Efficiency

Correctness

Complexity

- for analytical components and services

What's the Need?

Analytical programmers delivering correct, efficient components in the enterprise, on-time

This is one set of problems that functional-first programming helps solve

Why?

Observation #1

At the core of every functional-first language is:

simple, correct, robust code for solving **complex problems**

Observation #2

A highly interoperable language allows **rapid, non-intrusive deployment** and **integration** of components

... functional-first code is a part of a larger solution. With F# your code can be rapidly integrated and deployed.

Observation #2 cont.

Interoperable
languages remove
entire phases from the
analytical software
development process.

...no R → C#

...no Mathematica → C++

...no Excel → Java

Observation #3

Strongly-typed
functional-first
languages **maintain
efficiency**

...as good as C# and Java, and
sometimes C++

Observation #4

Strongly-typed
functional languages
help analytical
programmers tackle
more complex
problems

...more time in the domain, less
time on nulls and object
hierarchies.

Recap – How Functional-first Helps

Simple, correct, robust code

Interoperability eliminates entire phases

Strong-typing gives efficiency

Analytical developers empowered to solve complex problems

Example #1 (power company)

We have written an application to balance the national power generation schedule ... for an energy company.

...the calculation engine was written in F#.

The use of F# to address the complexity at the heart of this application clearly demonstrates a sweet spot for the language ... algorithmic analysis of large data sets.

Simon Cousins (Eon Powergen)

Example #1 (power company)

Time to Market

Efficiency

Interoperation ... Seamless. The C# programmer need never know.

Parallelism ...The functional purity ... makes it ripe for exploiting the inherent parallelism in processing vectors of data.

Correctness

Units of measure ... a huge time saver...it eradicates a whole class of errors

Code reduction... ... vector matrices...higher order functions eat these for breakfast with minimal fuss, minimal code. Beautiful.

Time to Market

Time to Market

Exploratory programming ... Working with F# Interactive allowed me to explore the solution space more effectively

Correctness

Lack of bugs... Functional feel strange. ... once the type checker is satisfied that's often it, it works.

Correctness

Unit testing ...a joy to test. There are no complex time-dependent interactions to screw things up....

Example #1 (Simon Cousins, Energy Sector)

350,000

lines of C# OO
by offshore team

The C# project took five years and peaked at ~8 devs. It never fully implemented all of the contracts.

The F# project took less than a year and peaked at three devs (only one had prior experience with F#). All of the contracts were fully implemented.

30,000

lines of robust F#, with
parallel + more features

An application to evaluate the revenue due from [Balancing Services](#) contracts in the UK energy industry

<http://simontcousins.azurewebsites.net/does-the-language-you-use-make-a-difference-revisited/>

Example #1 (Simon Cousins, Energy Sector)

Zero

bugs in deployed system

“F# is the safe choice for this project,
any other choice is too risky”

An application to evaluate the revenue due from [Balancing Services](#) contracts in the UK energy industry

<http://simontcousins.azurewebsites.net/does-the-language-you-use-make-a-difference-revisited/>

Implementation	C#	F#
Braces	56,929	643
Blanks	29,080	3,630
Null Checks	3,011	15
Comments	53,270	487
Useful Code	163,276	16,667
App Code	305,566	21,442
Test Code	42,864	9,359
Total Code	348,430	30,801

Example #2: F# in Finance

Time to Market

Correctness

Time to Market

Insurance Company Improves Time-to-Market with Enhanced Rating Engine

Overview
Country or Region: United States
Industry: Financial services—Insurance

Customer Profile
Headquartered in Columbus, Ohio, Grange Insurance offers automobile, life, home, and business insurance protection to policyholders in 13 U.S. states. It employs 1,500 people.

Business Situation

Solution
Using Microsoft® Visual Studio® Team System and Visual F#, the company

"With this streamlined developer rapidly deliver more powerful solutions they can deliver more choices and policyholders that much faster."

Glenn Watson, Associate Vice President, Personal Lines, IT

For nearly 75 years, Grange Insurance has provided products and services to policyholders in 13 states. To maintain its well-earned reputation for rating policies and performing what-if analyses, and other vital activities, Working Group and using the Microsoft® Visual Studio development environment and Microsoft F# programming language, Grange Insurance parallel

Customer: Financial services firm
Country or Region: Europe
Industry: Financial services—Banking

Customer Profile
A large European financial services firm offers banking and asset-management services to clients in 50 countries. In 2009, the bank earned more than U.S.\$6 billion in income.

- Software and Services**
- Microsoft Visual Studio
 - Microsoft Visual F#
 - Microsoft Visual Studio 2010
 - Technologies
 - Microsoft .NET Framework
 - Windows Presentation Foundation

Banking Firm Uses Functional Language to Speed Development by 50 Percent

"We could not have developed 200 models in two years without F# and Visual Studio. It would have taken us at least twice as long with our previous

Director at a large European

A large financial services firm in Europe sought new development tools that could cut costs, boost productivity, and improve the quality of its mathematical models. To address its needs, the bank deployed Microsoft F#, the Microsoft .NET Framework, and Microsoft Visual Studio. It will soon upgrade to Visual Studio 2010 and the integrated Microsoft Visual F#. With its new tools, the bank can speed development by 50 percent or more, improve quality, and reduce costs.

Business Needs
A large European financial services firm needed a development environment that runs on a desktop and on a remote cluster of servers that includes hundreds of customers

Example #3: F# in Insurance

Time to Market

I work for a large actuarial company... ...Despite adopting Agile/Scrum ...the usual delays, complications and sometimes ...failures.

Complexity

We used F#, and quickly created a system which would perform the necessary calculations highly efficiently, in parallel, and with a perfect match to the spreadsheet results.

Efficiency

All of the advantages which are commonly touted for F# do play out in practice. *Immutability, Easy Parallelisation, Expressiveness, Testability, Conciseness, Flexibility, Productivity*

[Company name omitted]

Correctness

Example #4: F# in Biotech

...F# rocks - building algorithms for DNA processing and [it's like a drug](#). 12-15 at Amyris use F#... A complete genome resequencing pipeline with interface, algs, reporting in ~5K lines and it has been incredibly reliable, fast and easy to maintain.. A suffix tree in 150 lines that can [index 200,000 bases a second](#)

Efficiency

Correctness

F# v. Python: F# has been phenomenally useful. I would be writing a lot of this in Python otherwise and [F# is more robust, 20x - 100x faster to run and faster to develop.](#)

Time to Market

Example #5: F# at Kaggle

At Kaggle we initially chose F# for our data analysis algorithms because of its **expressiveness**.

Taming
Complexity

We've found ourselves moving more and more of our application ...into F#. The F# code is shorter, easier to read, easier to refactor, and, because of the strong typing, contains **far fewer bugs**.

Correctness

Time to Market

As our data analysis tools have developed, we've seen domain-specific constructs emerge very naturally. As our codebase gets larger, **we become more productive**.

Example #6: F# in Advertisement Ranking & Rating @ Microsoft

Time to Market

Around 95% of the code in these projects has been developed in F#. F# allowed for **rapid development of prototypes**, and thus also rapid **validation** of the underlying mathematical models.

Taming Complexity

Complex algorithms, for example to compute Nash equilibria in game theory, can be expressed succinctly.

Correctness

Units of measure **reduced the chance of errors** dramatically: Prices, probabilities, derivatives, etc. can already be kept apart at compile time.

Example #7: F# for Social Gaming

F# is becoming an increasingly important part of our server architecture that supports our mobile and web-based social games with millions of active users. F# first came to prominence in our technology stack in the implementation of the rules engine for our social slots games which by now serve over **700,000 unique players** and **150,000,000 requests per day** at peaks of **several thousand requests per second**.

Efficiency

The F# solution offers us an **order of magnitude increase in productivity** and allows one developer to perform the work that are performed by **dedicated developers** on an existing Java-based solution, and supporting our agile approach and **bi-weekly release cycles**.

Time to Market

Yan Cui, Lead Server Engineer
<http://fsharp.org/testimonials>

Example #8: F# for Machine Learning at Microsoft

I wrote the first prototype of the click prediction system deployed in Microsoft AdCenter in F# **in a few days**.

Time to Insight

For a machine learning scientist, **speed of experimentation** is the critical factor to optimize.

Unlike C# and C++, F# was designed for this mode of interaction. Switching to F# was liberating and exhilarating.

Correctness

The world is moving toward functional programming with good justifications: the code is cleaner and **easier to debug** in a distributed environment.

Example #9: F# for Consulting

Our bids for tendered contracts in quantity are reduced because of the **price** of competitors because of the **increase in productivity** we achieved through F#. **Correctness** **Efficiency**

We are regularly able to deliver **correct, robust, performant** solutions **on-time**, which is what our customers value most. **Time to Market**

Daniel Egloff, QuantAlea Consulting, Zurich

Data is like water...

Data is like water...

- Everyone needs it. Everyone knows where to get it.
- Nobody is sure where it really came from, or goes to.
- ...really knows its true cost, or true value.
- ...likes to pay for it, or to share it.
- ...knows how much is wasted.
- You might get washed away by it.
- You only find out it was bad after you have drunk it.

Actually these days it's more like a flood...

The Problem

Our programming tools are **data-sparse**

getting data **into** a programming language is tiresome, error prone and boring

We need to bring data into the
language...

At internet scale, strongly tooled, strongly typed

Demo

Problem: Integrate all of freebase.com

“as if it were a library”

>40M entities, >1Billion facts, >24,000 types, >65,000 properties

A Type Provider is....

“Just like a library”

“A design-time component that computes a space of types and methods on-demand...”

“An adaptor between data/services and the .NET type system...”

“On-demand, scalable compile-time provision of type/module definitions...”

Theme #1

On-Demand Types = Internet Scalable
Magic

Theme #2

Many Data Sources, One Mechanism

All your types are belong to us....

CATS : ALL YOUR types ARE BELONG
TO US.

SQL #1

```
type NorthwndDb =  
    SqlConnection<ConnectionString = @"AttachDBFileName = 'C:\project:  
  
let db = NorthwndDb.GetDataContext()  
  
let customerNames =  
    query { for c in db. do  
        where (c.Ci  
        select c.Con  
        AlphabeticalListOfProducts  
        Categories  
        CategorySalesFor1997s  
        property  
        NorthwndDb.ServiceTypes.Simple  
        phabeticalListOfProducts:  
        System.Data.Linq.Table<Northwnd
```

SQL #2

```
let connectionString = @"Data Source=(LocalDb)\v11.0;Initial Catalog=Adventureworks2012;AttachDbFilename=.;User=sa;Password=;Server=.;"

[<Literal>]
let query = "
    SELECT TOP(@TopN) FirstName, LastName, SalesYTD
    FROM Sales.vSalesPerson
    WHERE CountryRegionName = @regionName AND SalesYTD > @salesMoreThan
    ORDER BY SalesYTD
"

type SalesPersonQuery = SqlCommandProvider<query, connectionString>
let cmd = SalesPersonQuery()
```

CSV

```

// Construct an R data.frame then plot pairs of returns
let df = R.data_frame(namedParams data)
R.pairs(df)
```

SQL #2 - Application

Tachyus is a Silicon Valley startup that aims to be “*a Data Start-Up for the Oil Industry*”. They aim to create an array of sensors and mobile applications to help oil and gas producers better record and analyze their wells. According to [the New York Times coverage](#):

The start-up represents an anomaly of sorts in Silicon Valley. Many new businesses focus on high-technology products for the Internet or green technology, but Mr. Sloss and his co-founders, Paul Orland and Francisco LePort, have instead homed in on the decidedly older and dirtier business of drilling for hydrocarbons.

Last week Tachyus announced that it has raised \$6M in funding from a group led by Founders Fund. At the time of the announcements, one of the Tachyus engineers announced that they went from “from zero to product launch in 12 weeks” and “we couldn’t have done it without F#”. Founder Paul Orland commented “we are using 100% F#”

Retweeted by [Community for F#](#)

Jack Fox @foxyjackfox · Apr 1

#tachyus went from 0 to product launch today in 12 weeks. Could not have done it without #fsharp tachyus.com

Providing Units of Measure

via F#'s Units of Measure

If the metadata contains units...

Dissipated	/meteorology/tropical_cyclone/dissipated	/type/datetime
Highest winds	/meteorology/tropical_cyclone/highest_winds	/type/float <i>Kilometres per hour</i>
Lowest Pressure	/meteorology/tropical_cyclone/lowest_pressure	/type/float <i>Millibar</i>
Damages	/meteorology/tropical_cyclone/damages	/measurement_unit/dated_money

```
let cyclones = data.`Science and Technology`.Meteorology.`Tropical
```

```
let topWind = cyclones.`Hurricane $`
```

```
val topWind : float<metre/second>
```

```
Full name: Demo.topWind
```

...then these can be projected into the programming language.

FSharp.Data

fsharp.github.io/FSharp.Data

on NuGet, use it in Visual Studio today

Summary

Scalable (meta)data integration into programming is a key challenge of our era

“F# type providers” are a simple, powerful point in the design space

The techniques have many, many applications

People use this “for real” in production F# systems

In Summary

Open, cross-platform,
strongly typed, efficient,
rock-solid stable

The safe choice for
enterprise data
programming

F#

Unbeatable data
integration

Visual F# - tooling you
can trust from Microsoft
